

Chrome on Mobile @ 60fps

Now and in the Future

Daniel Sievers, Nat Duca

Chrome!

- As-fast-as-we-can-be web browsing on all platforms
- Since KitKat / 4.4, also Android WebView
- One codebase across all platforms

Chrome!

Chrome android just a variant on desktop

What makes rendering hard:

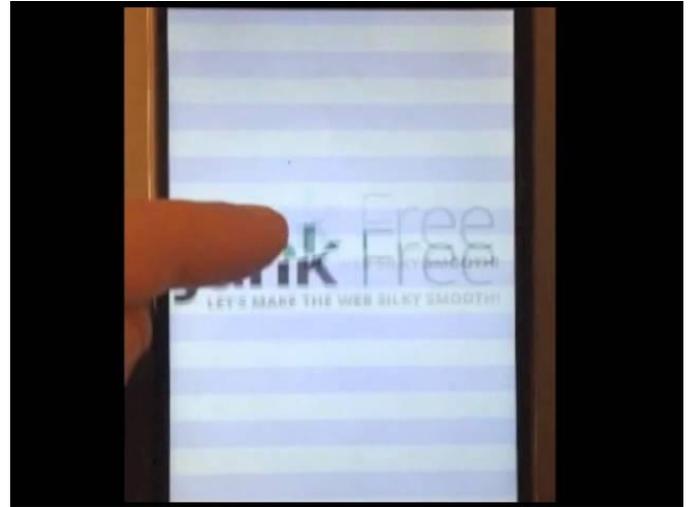

- pixel accuracy
- spec compliance
- sandboxing

Web Rendering Through the Ages

1989-2007:

- Software rendered
- 18 years of accumulated rendering features
- Highly influenced by CPU raster capabilities
- Most of focus on page load time, not rendering
- Documents that scroll

A Web Gem....

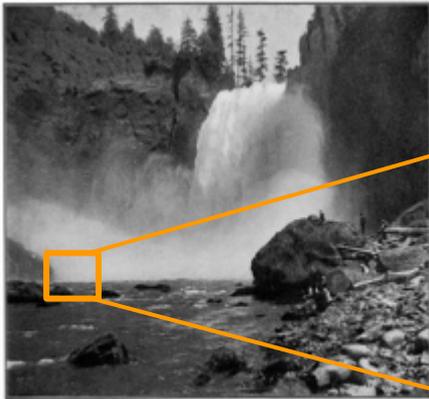

```
{  
  width: 0px;  
  height: 0px;  
  border-style: solid;  
  border-width: 0 10px 10px 10px;  
  border-color: transparent transparent  
               #007bff transparent;  
}
```

Another Web Gem

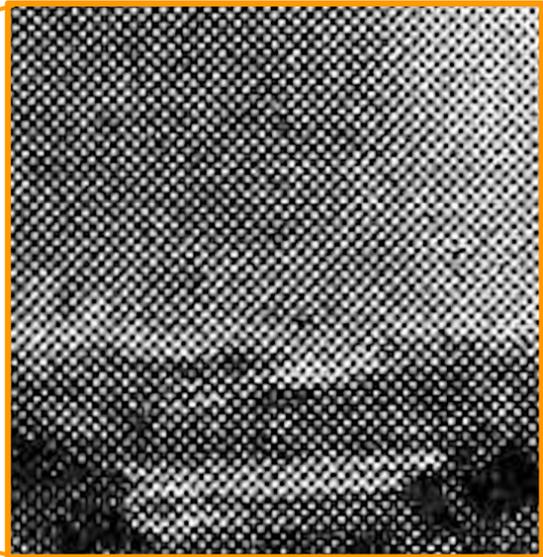

```
<!-- native size of foo.jpg is 4594x3770 -->  

```

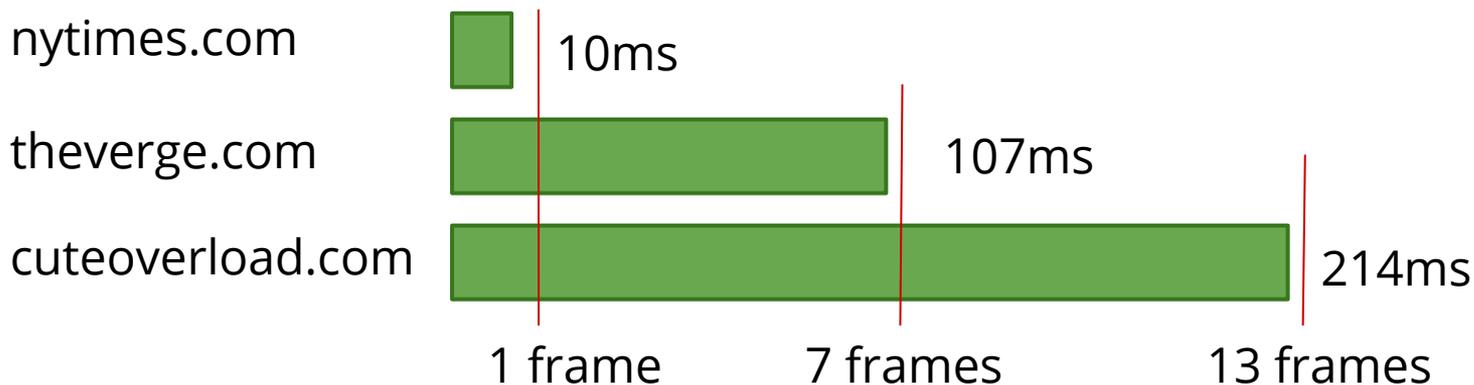

SNOQUALMIE FALLS

Two hundred and sixty-eight feet high. Twenty-eight miles east from Seattle. Reached by Northern Pacific branch line.

So as you would expect....

From-scratch software rasterize time is agonizingly slow:

(Nexus 10)

Web Rendering Through the Ages

2007-present:

- iOS Safari led the charge
- Assume the web page is incurably janky.....

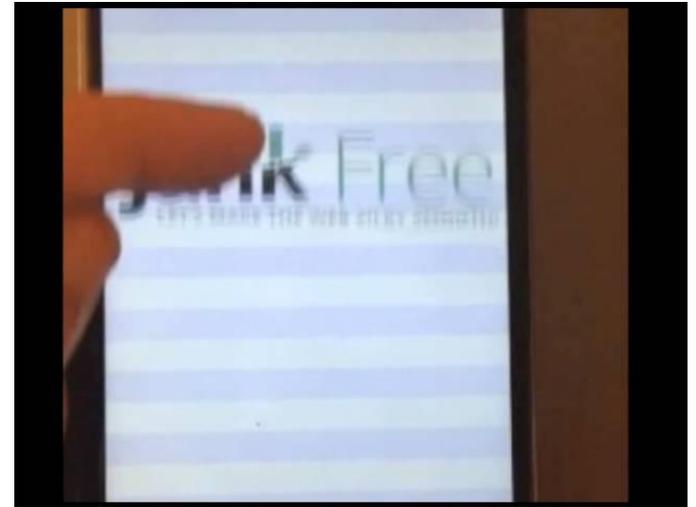

Layers + Compositing FTW

+

=

MONDAY, MARCH 24

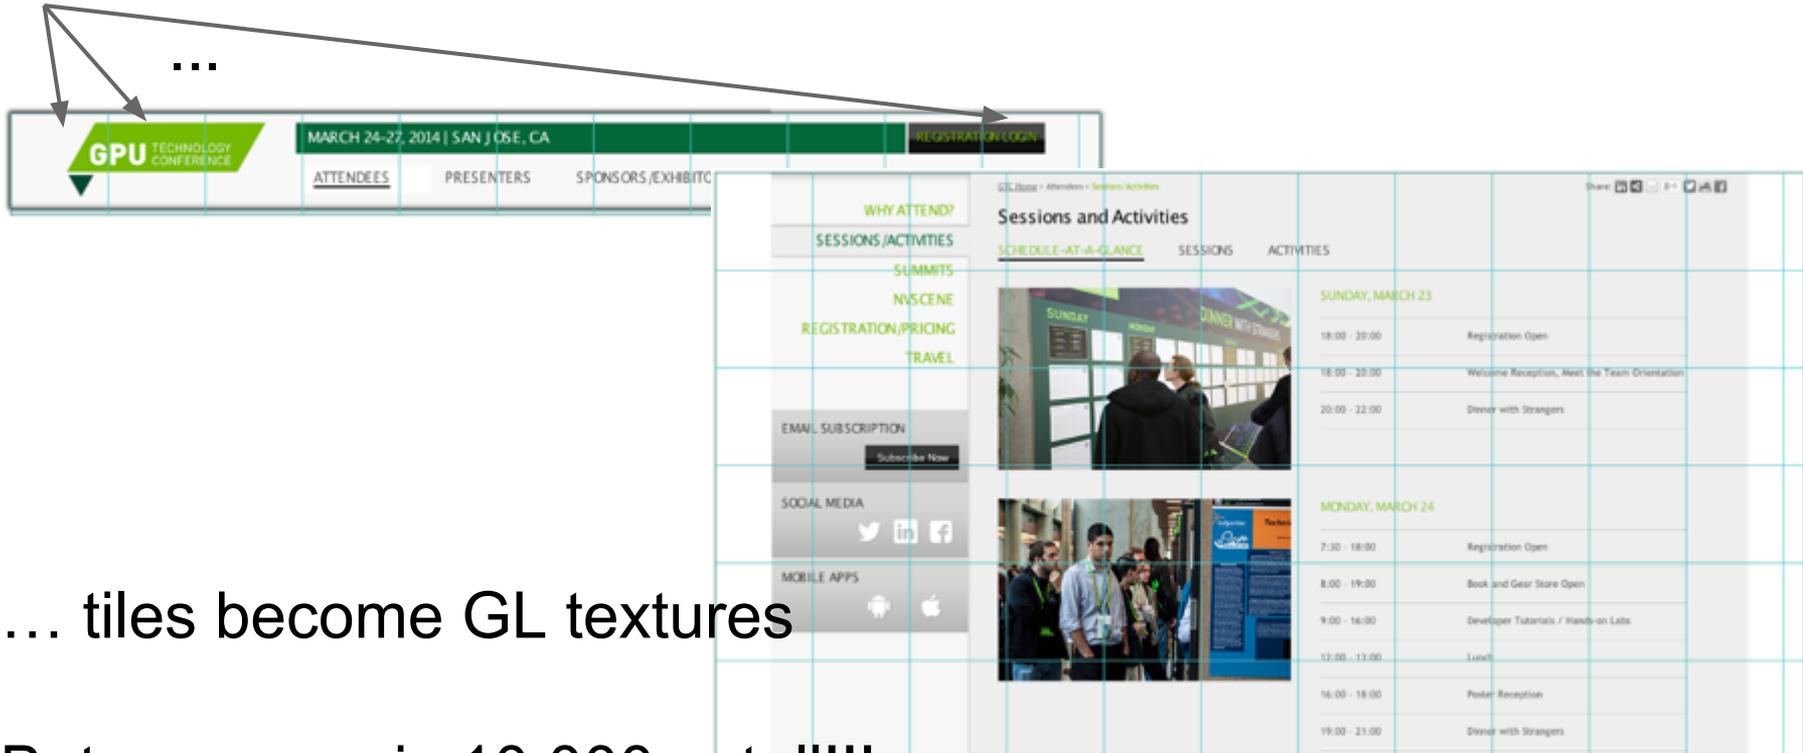

7:30 - 18:00	Registration Open
8:00 - 19:00	Book and Gear Store Open
9:00 - 16:00	Developer Tutorials / Hands-c
12:00 - 13:00	Lunch
16:00 - 18:00	Poster Reception

Layers created for....

- fixed position
- scrolling elements
- animations
- will-change hint (*)
- ... lots more

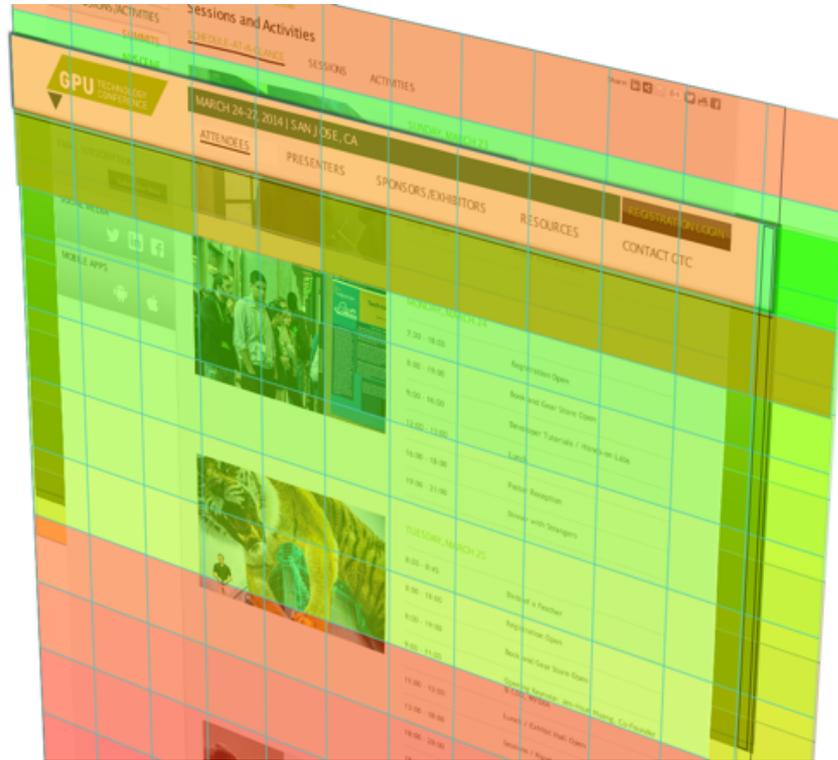

Layers are diced up into tiles..

... tiles become GL textures

But, cnn.com is 10,000px tall!!!

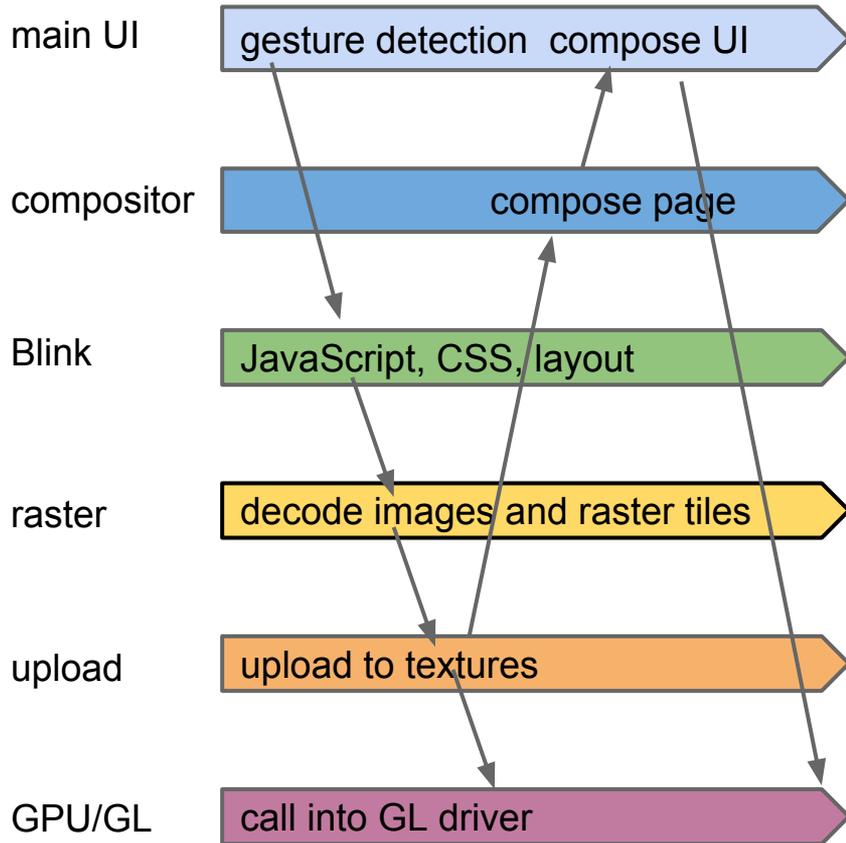

... then prioritized and rasterized

SO.....

layers + tiles + compositing is enough, right?

The Naive Way to Scroll

- The good: This is how the web defines things as happening.
- The bad part: so many places things can go wrong...

Faster: Threaded scrolling

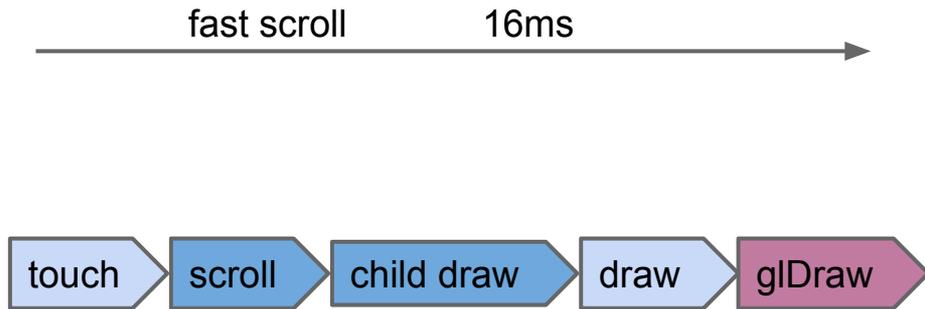

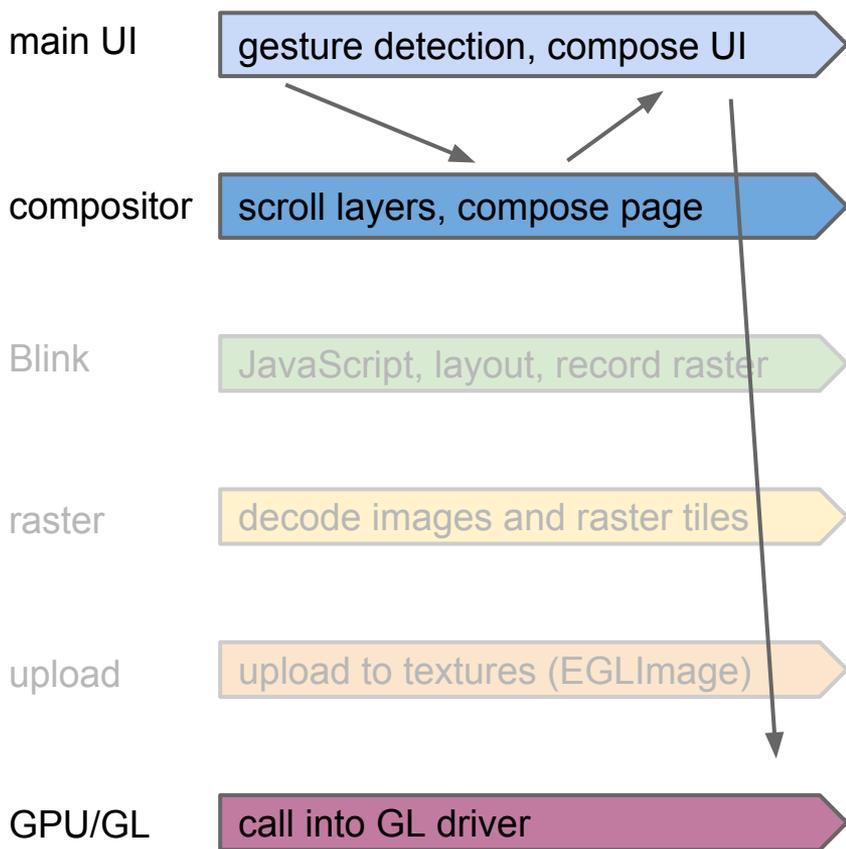

optimize for the most important cases

- scrolling
- pinch

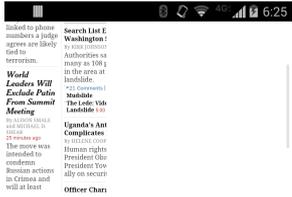

introduce dedicated composting thread

checkerboard when the user exposes things that are not ready

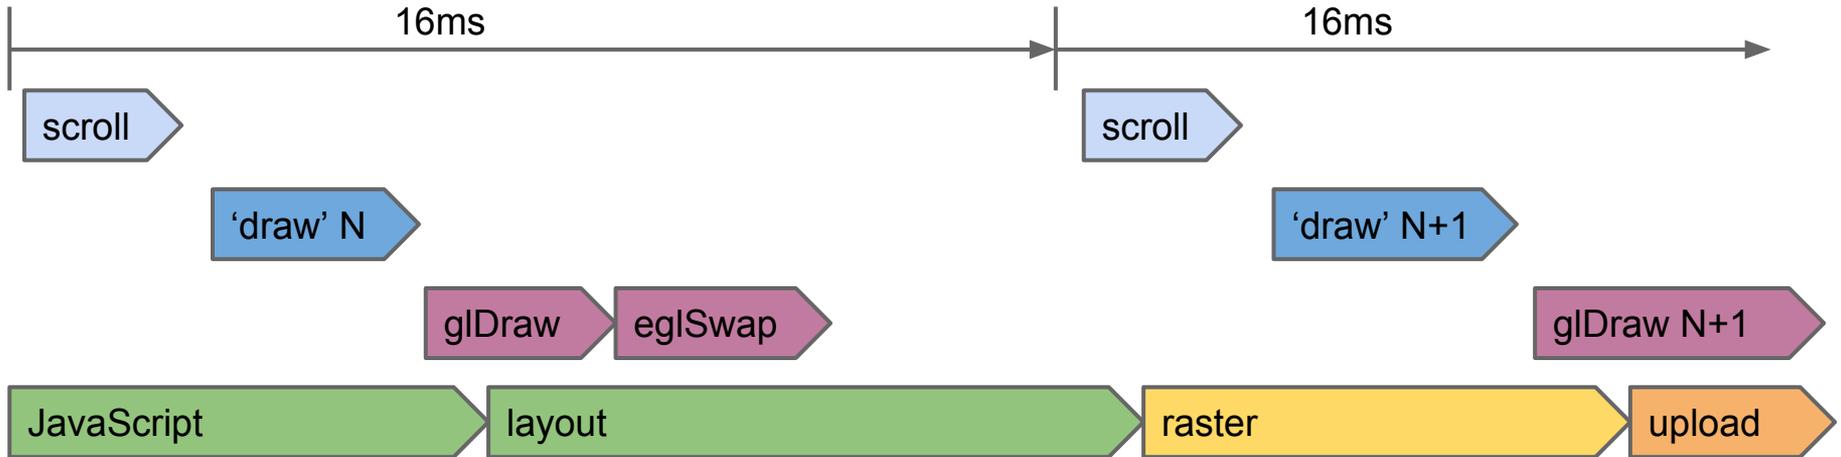

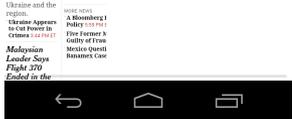

Fast Path Scrolling

Scroll with potential checkerboarding while Blink thread works on future frames.

Page is fully responsive to touch with potentially some missing tiles. In parallel, layout and rasterization takes place for future frames.

Compositor Thread Animations

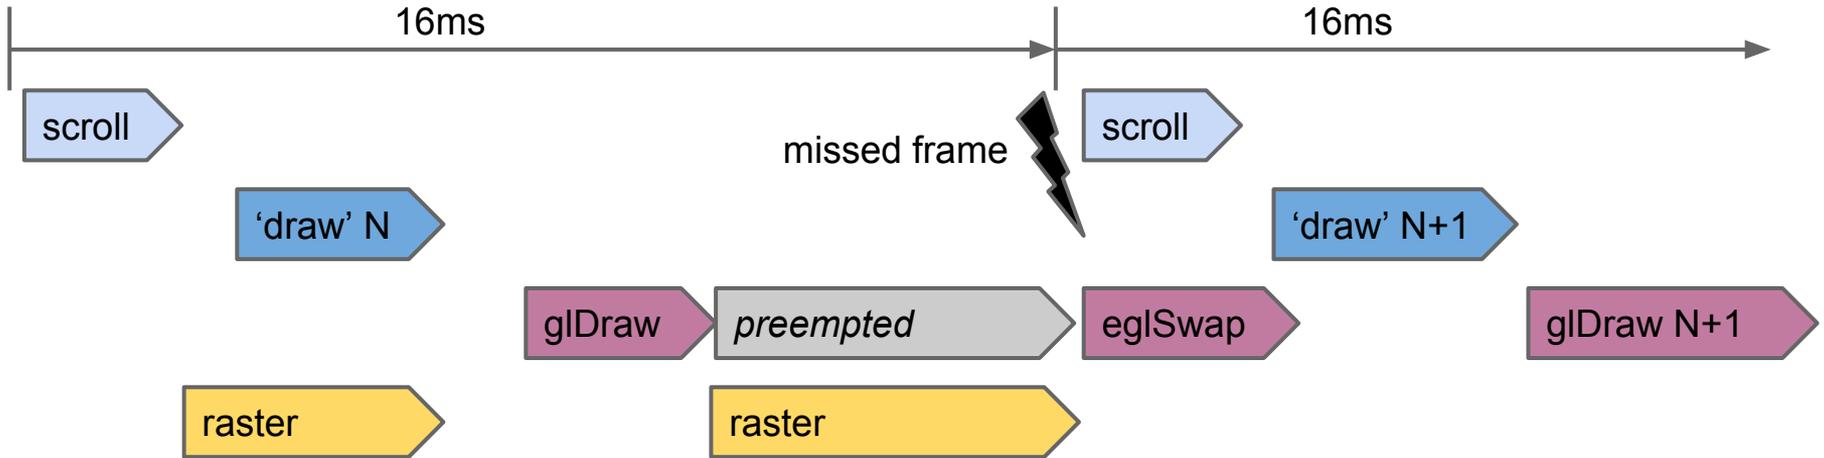

Compositor thread can do more than scrolling:

- opacity
- transforms
- pixel filters

http://jankfree.org/examples/smooth_simple_with_trace_markup.html

Multithreading realities

Great on powerful desktop, but more fragile on mobile due to fewer cores and power management. Threads can get descheduled with the pipeline latency increasing.

Beyond

From 2007 until recently, we've been focused on compensating for jank

This makes the web kinda broken: we're bypassing the web with fast scrolling, pinch

Conceptual good things

- So this leads us to thinking about GPU rasterization [and many other things]
- Sounds good in concept...
 - Better throughput when full screen changes
 - Avoids desched problems

but....

Another Web Gem!

```
{  
  width: 50px;  
  height: 50px;  
  background-color: #fff;  
  border-style: solid;  
  border-color: #ff0000 #00ff00  
               #0000ff #ff00ff;  
  border-width: 16px 24px 32px;  
  box-shadow: 4px;  
  border-radius: 10px;  
  padding: 12px 14px;  
  box-shadow: 10px 10px 4px #c2c2c2,  
             inset 0px 0px 10px 10px #00c0c0;  
}
```

More web gems

The screenshot shows a Reddit post in the 'PROGRAMMING' subreddit. The post title is 'Effectively managing memory at Gmail scale' by user 'OsQu', submitted 5 days ago with 651 upvotes and 201 comments. The comments are sorted by 'best'. The top comment is by 'Heazen' (181 points) discussing the need for 1GB of memory for reading emails. A reply by 'Hurdy' (73 points) notes that Gmail is one of the longest-running web apps. Another reply by 'Joelthellon' (57 points) says it's still 'just' an email client. A final reply by 'TomorrowPlusX' (47 points) asks 'Gmail is the new emacs?' with the comment '//eight megs and constantly swapping'. A mouse cursor is visible over the last comment. A thin, dashed vertical line is present on the left side of the comment area, highlighted by an arrow from the text below.

hairline with dashing

Our approach: hybrid rasterization

- Rasterize with GPU, but only when it makes sense
- Lots of heuristics (like when we make layers!)
 - will-change & animation: strong signals to use GPU raster
 - Vetoing: this content has something whacky, fallback to CPU

Pinch zoom...

We consider pinch zoom solved:

- Crisp-up when there are CPU resources
- Blurry when needed to preserve frame rate

Pinch zoom is a content bug: the page should have been mobile friendly in the first place.

An example

This is some prefix text.

i am a message header
first subtitle

Contrary to popular belief, Lorem Ipsum is not simply random text. It has roots in a piece of classical Latin literature from 45 BC, making it over 2000 years old. Richard McClintock, a Latin professor at Hampden-Sydney College in Virginia, looked up one of the more obscure Latin words, consectetur, from a Lorem Ipsum passage, and going through the cites of the word in classical

Sw
rasterized

GPU
rasterized

Going fast

98% of what we get are simple rects & drawText

- Most paths end up being rounded-rect corner cases

Biggest concerns with GPU raster are:

- Overdraw
- Clipping
- Image uploads
- GLES2 limitations

Onward!

- Re-explain rendering in GPU friendly terms
- Keep minimizing power draw
- Make content viable without the threads
- Integrate more game engine and rendering tech
